

Measuring and Valuing Ecosystem Services: InVEST and Modeling Approaches

Adrian L. Vogl

Comparative Groundwater Law & Policy
Workshop
April 9, 2013

A Modeling Approach

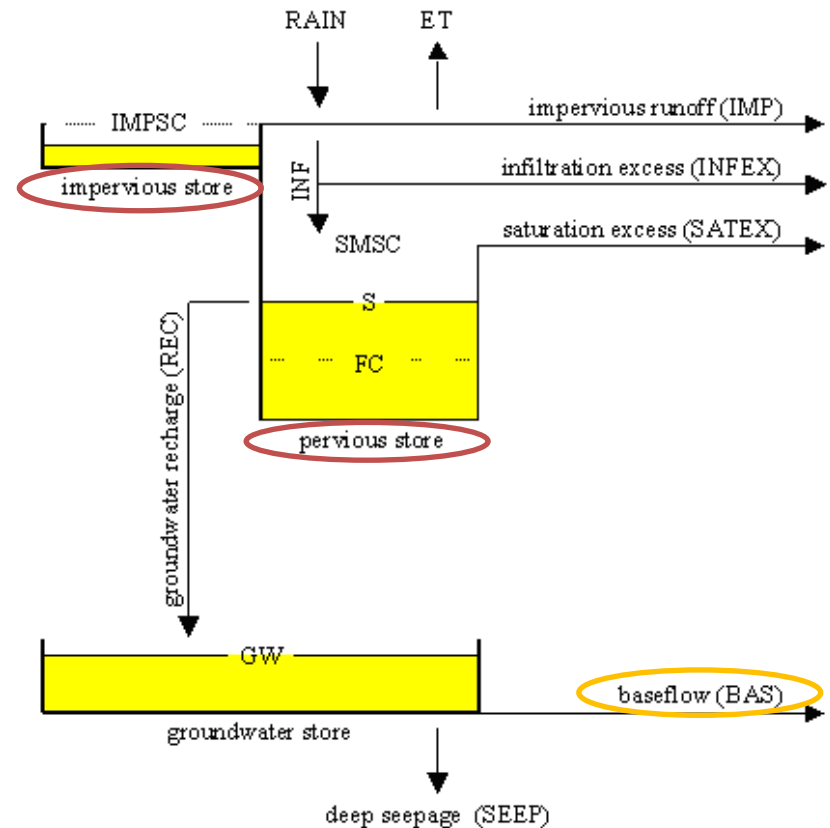

Simple conceptual reservoir models
(SWMM, Sacramento SMA,...)

Advantages:

Simple to develop/calibrate

Limitations:

No physical representation of processes
(limits predictive performance in a
context of LU/climate change)

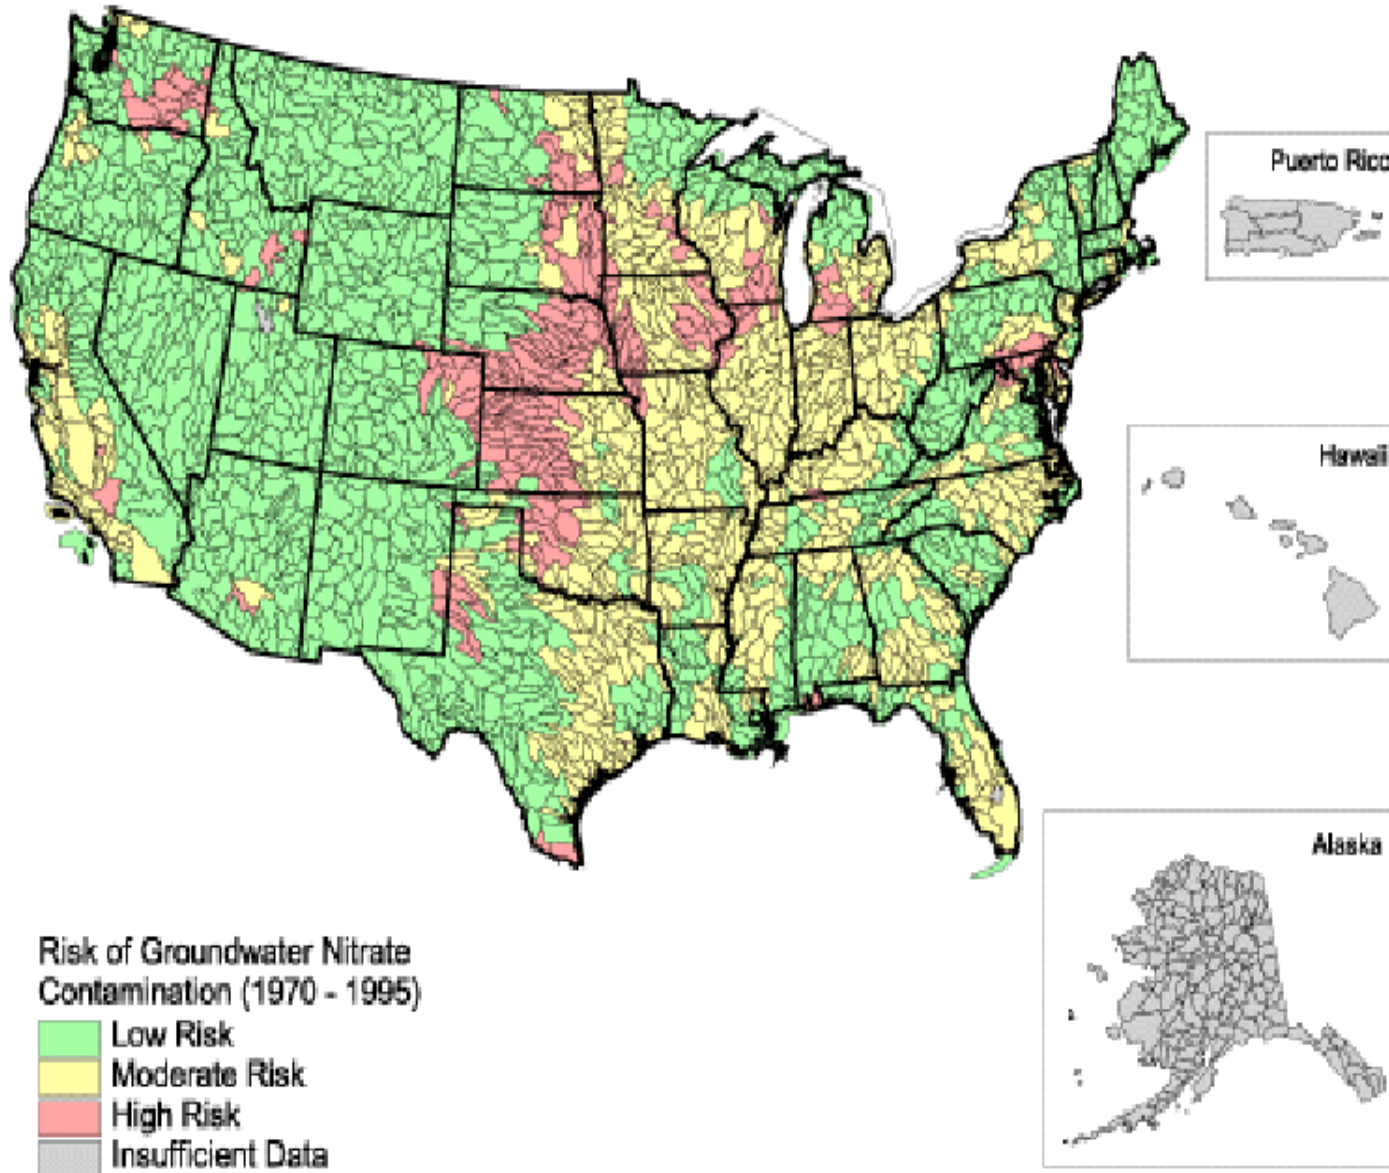

Source: (eWater 2012)

InVEST Annual Water Yield Model

Diagnostic Screening Approaches

Geology

Riparian Areas

Modeled Recharge

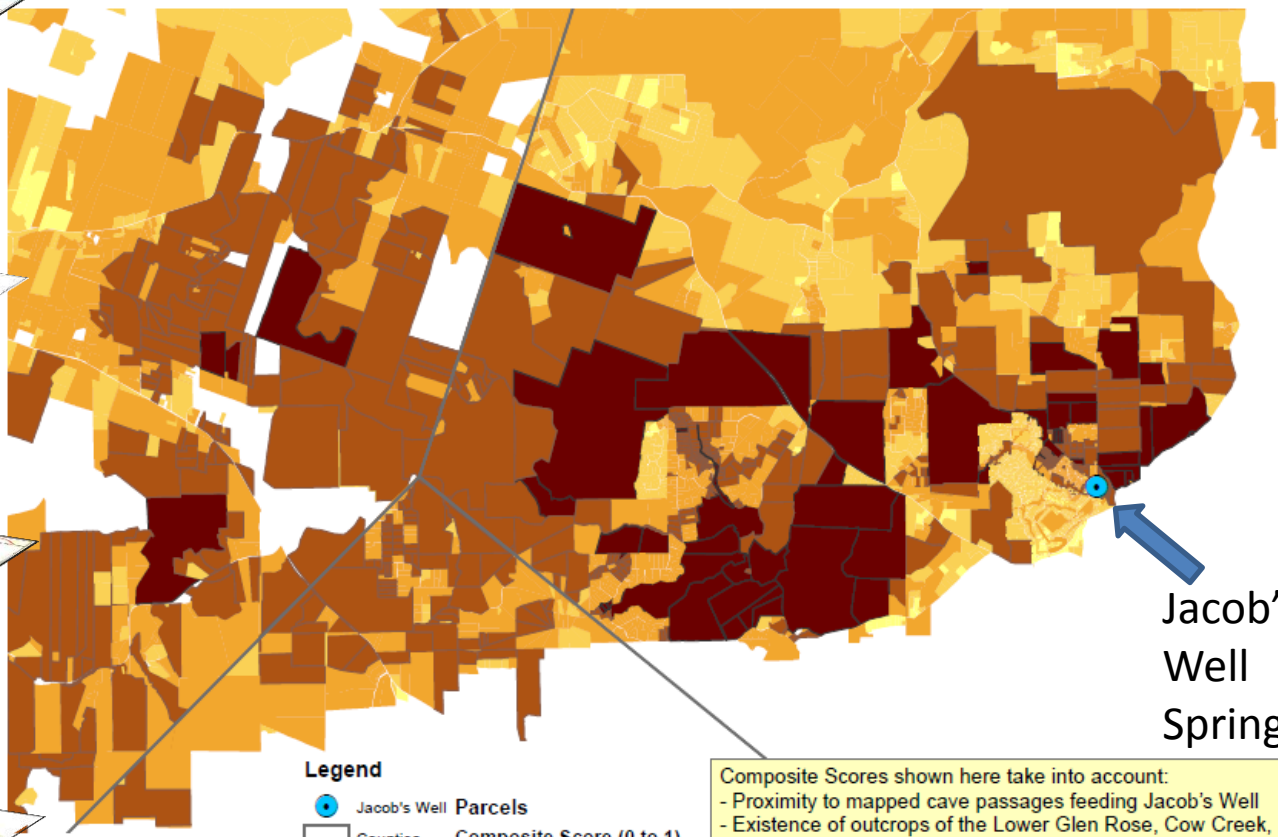

Endangered Species Habitat

Infrastructure/Threats

Composite Ecosystem Service Scores Jacob's Well Probable Contributing Area

Jacob's Well Spring

Legend

- Jacob's Well
 - Counties
 - Parcels
 - Composite Score (0 to 1)
- | |
|-------------|
| 0.00 - 0.18 |
| 0.19 - 0.36 |
| 0.37 - 0.54 |
| 0.55 - 0.73 |
| 0.74 - 0.91 |

- Composite Scores shown here take into account:
- Proximity to mapped cave passages feeding Jacob's Well
 - Existence of outcrops of the Lower Glen Rose, Cow Creek, or Hensell Sand karst formations
 - Mapped karst feature or fault present
 - Average annual groundwater recharge
 - Proximity to riparian areas
 - Potential golden-cheeked warbler habitat
 - Location outside a utility CCN

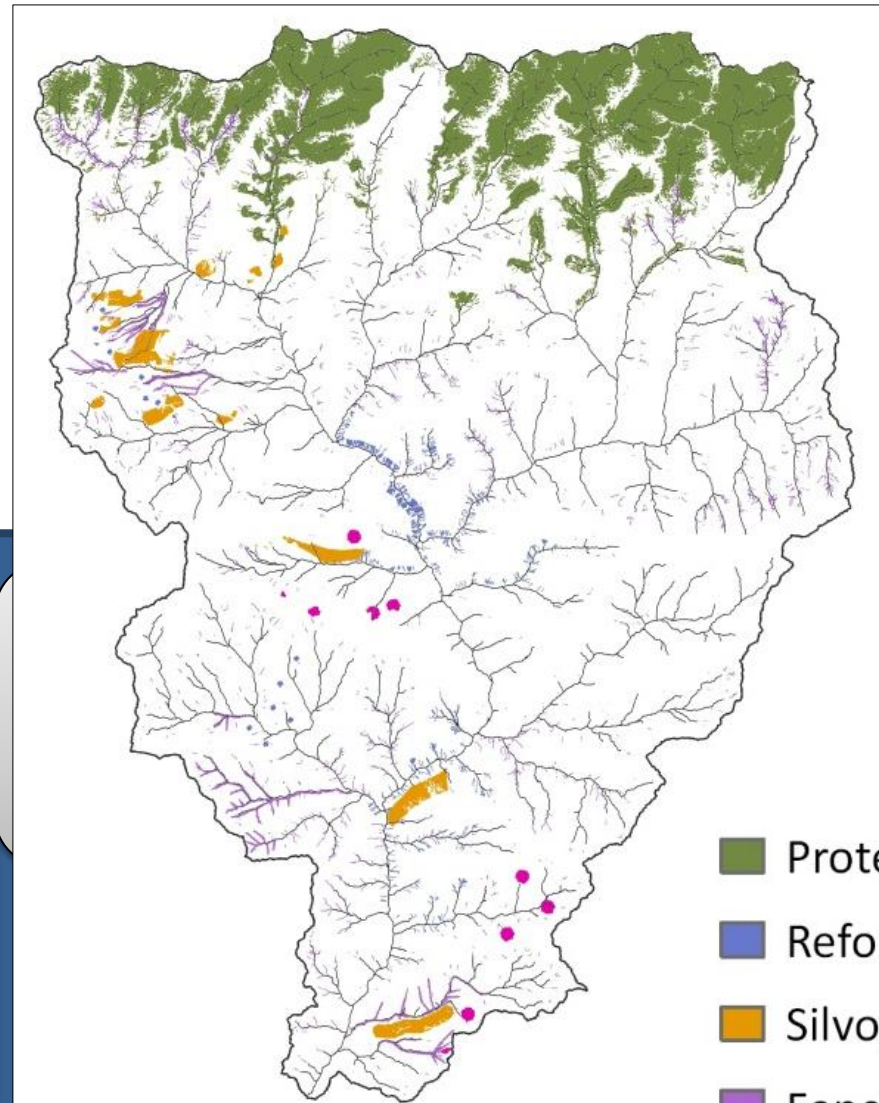

RIOS

RIOS MODULES

Portfolio Builder

- Erosion Control (Hydro, Drinking Water)
 - Nitrogen Regulation
 - Phosphorus Regulation
- Groundwater Recharge
 - Flood Mitigation
- Dry Season Baseflow
 - Biodiversity
 - “Other”

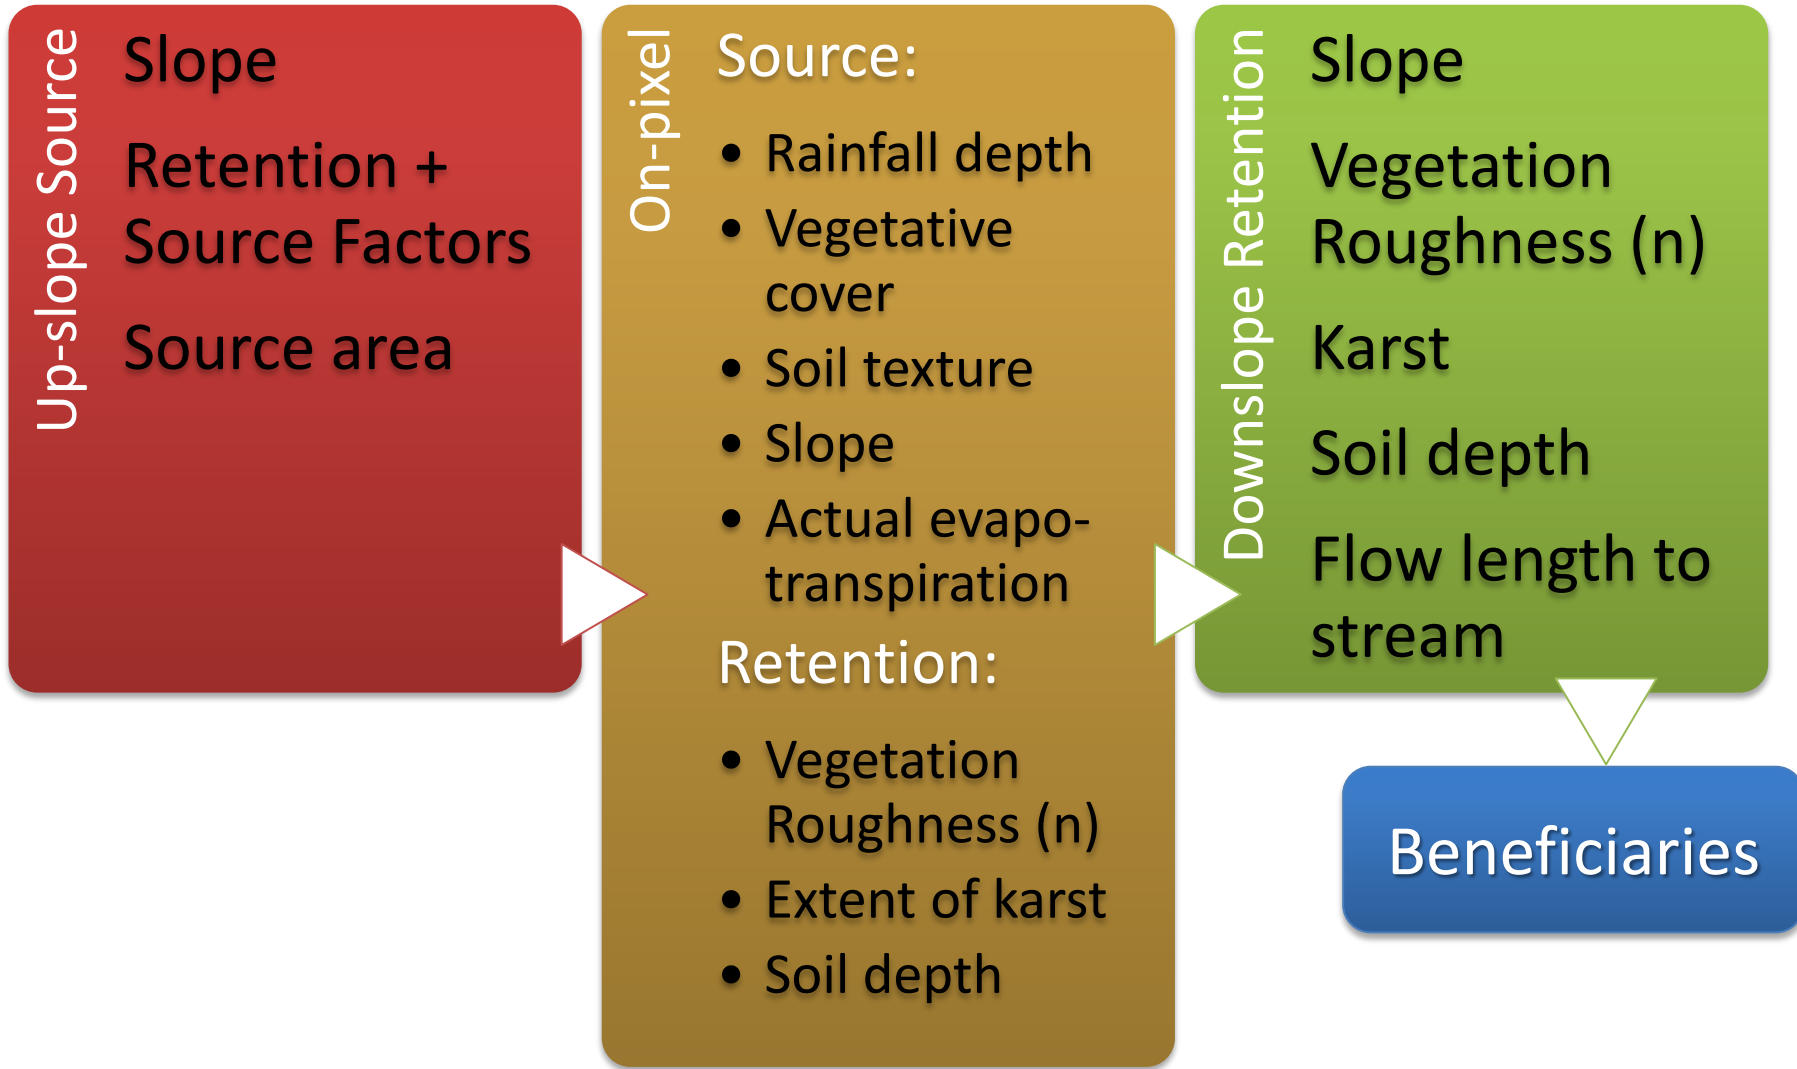

- Protection
- Reforestation
- Silvopasture
- Fencing
- Enrichment
- streams

RIOS Ranking Models

- Rank where land management changes will have the *greatest impact* on the selected service
- Factors determined through literature review
- Compromise between process representation and data availability
- Diagnostic screening, not process representation

Groundwater Recharge Enhancement

Groundwater Recharge Enhancement

Challenges/opportunities

- Need to clearly define the **desired outputs of the model** (i.e. the inputs to the **ES valuation** modules):
 - Complete representation of the groundwater flow in a watershed is challenging (getting the **supply** right)
 - Clearly define and delineate deep groundwater versus subsurface flow, relate to services
- Model **validation**/uncertainty analyses
 - Informs **data collection** (e.g. need for soil moisture/gw level monitoring?)
 - Develop a simple **testing framework** to understand what the model is able to represent

Challenges/opportunities

- Need to target the **processes of interest** and develop **conceptual models** for these processes/services:
 - **Maintaining groundwater-dependent ecosystems**
 - Improve representation of groundwater from the unsaturated zone versus deep groundwater
 - Improve linkages between groundwater and ecosystems
 - **Maintenance of baseflow**
 - Improve representation of shallow interflow
 - **Water supply for groundwater pumping**
 - Represent aquifer as a lumped reservoir
 - **Maintaining groundwater quality**
 - Link models of groundwater contamination to land management/ natural capital

Challenges/opportunities

- Making the link from **processes** of interest to **services & value**
 - Improve trade-off dynamics between surface- and ground-water
 - New valuation models, i.e. supply from groundwater pumping
- Different approaches required for modeling biophysical system, linking to beneficiaries, and economic valuation
